Q: What happens when two linearly polarized waves are intersected? In the diagram below, a wave's linear polarization is labeled 1 and a wave's circular polarization is labeled 2. If the waves' amplitudes are equal, what will the output be? I'm confused because when I hit the waves with a polarimeter, it seems like they will cancel each other, so what I am seeing is a circularly polarized wave with an amplitude of zero. A: It depends

on the relative phases of the two polarizations. If the phases are exactly the same, then the two waves add; if the phases are exactly 180 degrees out of phase, then the two waves subtract. In the diagram, for example, I've drawn the case where the phases are equal. A: Why should we add them in the first place? Assuming the waves are in phase with each other, we just add amplitude and get the same results as with a single linearly polarized wave. If the waves are out of phase, then the waves will have opposite signs and we will get minus the

amplitude of the two waves to get the net effect. Q: CKEditor does not support linking to external resource? I am working with CKEditor 4.1. The editor displays this message when I try to add a hyperlink: CKEDITOR.editor.prototype.addLink = CKEDITOR.tools.override(CKEDITOR.editor.prototype.addLink, function(originalFunc) { CKEDITOR.tools.setErrorFunction(this.checkLink, this); originalFunc(this, this.baseDocument, this.config.baseHref); }); I don't see this message when I use TinyMCE, do I have to change something here? A: CKEDITOR is

a software which provides a text editor feature, it's not a web framework, tinyMCE is the core of the rest of the framework and is compatible with almost all the features that you want (content filtering, autocomplete, image, video upload, etc...). You can host the tinyMCE framework and include it inside a div and it will work fine, however you cannot use the tinyMCE as a stand-alone editor, you need to include tinyMCE

I Want Those Milkshakes

Milkshakes are the Milkshakes, Don't kid yourself. They are everything you should want, and more. They are the key to so many amazing foods, and now they are in the pastry world. The day before I had lunch with a colleague, he asked me about my son's birthday. He said it was the next day, and I said yes that it was Milkshakes, and he was excited by the announcement. Since then I have been figuring out a few things. You are never too old to have a milkshake. I bought a large 24 count box of Jellies Sundae's and made my own personal pack for 5 dollars.

If you are looking for a good deal, you might want to check out Ralph's. They are a good deal, but not as good as Jellies Sundae's. They don't make milkshakes but they do have some amazing confections for your crunches and pastries. You could make a large pack out of vanilla ice cream, blueberry, strawberry, and lemon. If you are going to add chocolate, make it! Milkshakes aren't just for kids. I used to think kids couldn't be trusted with these treats. As soon as they were old enough to turn into bad kids, they learned to drink sugary drinks and eat

unhealthy food. When my granddaughter was around 6 months old, her babysitter told me she had visited her parents and that my granddaughter only had one type of drink; pureed juice. I was outraged, and then I realized that the babysitter had a valid point. Babies need nutrition! While I don't want to give them junk food, I would rather give them fluids than none. Give them soup or broth and milk. And for real, add some broccoli and spinach to their "food." Milkshakes are great for a midday pick me up. "Why do you have a milkshake?" my

daughter asked when she found me in the kitchen eating my milkshake. “For the fun part,” I answered, and handed her one. She giggled before she finished it. She is not usually one to have sweet drinks. She doesn’t drink soda because it is too sweet. “Why are you having a mil
